
Contents

1. Scilab Basics.....	1
1.1 Commonly-used Scilab Functions in Control Engineering	2
1.1.1 Matrix operations	3
1.1.2 Complex Numbers	5
1.1.3 Polynomials and Rational Functions.....	6
1.1.4 Plotting Functions	8
1.2 Writing Scripts and Functions.....	11
1.3 Simulation with Xcos.....	15
1.4 Scilab GUI.....	20
1.5 Conclusion	21
2. Arduino Setup and Programming.....	22
2.1 Build a Poorman Shield	22
2.2 Peripherals used for Feedback Control	23
2.3 Construct Command Interpreter.....	27
2.4 Improve Sketch with Functions	31
2.5 Timer Library	35
2.6 Real and Simulated Response Comparison	39
2.7 Communication with Scilab via the Serial Toolbox	42
2.7.1 Installation.....	42
2.7.2 Serial Toolbox Essentials.....	42
2.7.3 Build a Simple Command GUI.....	44
2.7.4 Data Processing of Received String.....	49
2.8 Conclusion	52
Exercises	53
3. Linear Continuous-time Systems and Feedback Properties	56
3.1 Transfer Function Formulation	56
3.1.1 Transfer Function Block in Xcos Model.....	59
3.2 Frequency Response	60
3.2.1 Transfer Function and Frequency Response Relationships	61
3.3 The Benefits of Feedback	66
3.4 Feedback Properties	73
3.4.1 Tracking Performance.....	73
3.4.2 Closed-loop Stability	76

3.4.3	Stability versus Gain Adjustment	77
3.4.4	Disturbance Attenuation Performance	79
3.4.5	The Sensitivity Transfer Function	81
3.5	Conclusion	83
	Exercises	83
4.	PID Control	85
4.1	Different Forms of PID	85
4.2	Effect from Saturation	89
4.3	Tuning the PID Parameters	91
4.3.1	ZNFD Manual Tuning	91
4.3.2	Automatic Tuning using Relay Feedback	95
4.4	Advanced Features of PID Controller	97
4.4.1	Derivative Term Replacement	97
4.4.2	Command Weightings	97
4.4.3	Anti-windup Schemes	98
4.4.4	Simulation of Full-featured PID Controller	101
4.5	Conclusion	103
	Exercises	104
5.	Discrete-time Systems	105
5.1	Hybrid Feedback Systems	105
5.2	Sampling Analog Signal	106
5.3	Discrete Systems Representation	107
5.3.1	Continuous-time Transfer Function Approximations	108
5.3.2	Closed-loop Stability	113
5.3.3	Stability Region Mappings	115
5.4	Discrete-time System Implementation	116
5.4.1	Discrete or Hybrid Simulation	116
5.4.2	Algorithm Formulation from Difference Equation	117
5.4.3	Implement a High-order Transfer Function	118
5.5	HIL Implementation	124
5.6	Conclusion	130
	Exercises	130
6.	PID Controller Implementation	131
6.1	Discrete-time Approximations	131
6.2	Conversion to Algorithm	133
6.2.1	Improve Noise Immunity with Moving Average Filter	144
6.3	PID Autotuning Implementation	145
6.3.1	Select Oscillation Center	145
6.3.2	Build a Relay in Software	145
6.3.3	Oscillation Amplitude Detection	146

6.3.4	Oscillation Period Detection	146
6.3.5	PID Parameter Computation	147
6.4	Full-featured PID Controller Implementation.....	149
6.5	Conclusion	155
Exercises	155
7.	System Identification.....	156
7.1	Classification of SysID	156
7.1.1	Input Choices	157
7.1.2	Non-Parametric SysID	158
7.1.3	Parametric SysID	160
7.2	Scilab Script for Flexible LSID Algorithm.....	166
7.3	Conclusion	172
Exercises	172
8.	Model-based Feedback Control.....	175
8.1	Feedback Requirements for SISO Systems	176
8.1.1	Performance Criteria	176
8.1.2	Stability Criteria.....	177
8.1.3	Design Criteria Imposed on Loop Transfer Function	178
8.1.4	Bode Gain-Phase Relationship.....	179
8.2	State-space Representation	190
8.2.1	State Feedback Control	193
8.3	H-infinity Control Synthesis	206
8.3.1	Problem Formulation	206
8.3.2	Disturbance Attenuation	207
8.3.3	Tracking	209
8.3.4	Weight Selection.....	210
8.4	Flexible Structure for Control Algorithm	222
8.5	Conclusion	230
Exercises	231
Appendix		
A.	QEI Shield for Arduino.....	232
A.1	Hardware Prototype	233
A.2	Slave Software Development.....	234
A.2.1	QEI Module Initialization	235
A.2.2	Reading and Writing the Position Register.....	235
A.2.3	I2C Module Initialization.....	236
A.2.4	State Machine for I2C Slave	237
A.2.5	Configure PIC24EP to 70 MIPS Performance.....	240
A.3	Arduino as I2C Master.....	241
B.	Flexible eXperiments (FX) Sketch for Arduino UNO	247
	Bibliography.....	274
